STOP NOISE

For improved performance

Press Release

At Critical Communications Europe & BAPCO 2019, Stop Noise presents the new Hybrid X smart modular structure, which allows it to be used with almost any LTE smartphone

At the Critical Communications Europe & BAPCO 2019 (STAND F36) Stop Noise presents Hybrid X, a tactical modular extension that has been designed to be used with almost any LTE smartphone regardless of brand and model. Large buttons allow Hybrid X to be used even with gloves in hand.

Ricoh Arena, Coventry, UK, March 12th-13th 2019: At Critical Communications Europe & BAPCO 2019 in Coventry, UK, March 12th to 13th, Stop Noise presents a bold and innovative Hybrid X concept. With Hybrid X, user organizations can connect their LTE smartphone to any two-way radio, and utilize worldwide LTE network. Hybrid X tactical extension can be customized to fit in almost any smartphone due to its smart modular structure. Integrated gateway functionality of Hybrid X makes communication between any radio systems possible. Features include rugged keypad with large PTT buttons, video streaming quick button, loud and clear audio (DSP), mic gain control (AGC), IP68 rating etc. Android UI provides intuitive user experience, allowing user organization to design their own communication software.

“With Hybrid X tactical modular extension an LTE smartphone and a PMR radio can be combined to provide new data intensive services for all PMR user groups; from public safety and security to healthcare professionals and industries. The concept has been developed according to customer needs and feedback. Hybrid X, a tactical modular extension fulfils the requirements of different user groups and enables important additional features such as group gateway between PMR and LTE users, charging on-the-go, body worn camera and dashboard camera with the help of the smart holder and vehicle holder. Hybrid X also enhances the usability of any Android LTE phone in any user group in any environment with more robust structure, better sound pressure level and improved operation through a keypad that can be used with gloves on. Hybrid X contains a digital signal processor (DSP), that compensates background noise of both received and transmitted audio.” - Markku Nieminen, Stop Noise Finland CEO

As the LTE infrastructure is being built and standards for secure public safety networks are being implemented, Hybrid X allows interconnected operation of LTE and TETRA, and it also lowers the barrier to LTE adoption for organizations. This way the investment into new technology can be incremental.
